What are digital elevation models (DEMs)?

A digital elevation model is a 3D CG representation of a terrain's surface - commonly of a planet, moon, or asteroid - created from a terrain's elevation data. A "global DEM" refers to a discrete global grid. DEMs are used often in geographic information systems, and are the most common basis for digitally produced relief maps. While a digital surface model may be useful for landscape modeling, city modeling and visualization applications, a digital terrain model is often required for ...
