Mine Ventilation and Air Conditioning, 3rd Edition | Wiley

The historic role of ventilation was to provide a flow of fresh air sufficient to replace the oxygen consumed by the miners working underground. Contemporary mine ventilation primarily deals with noxious gases (mainly generated by trackless equipment underground).

ventilation often will cause lower worker efficiency and decreased productivity, increased accident rates, and absenteeism.

MINE VENTILATION SYSTEMS

Air travels from the surface through the mine to this low pressure point. Airflow in a mine is induced by pressure differences between intake and exhaust openings. The pressure difference is caused by imposing some form of pressure at one point or a series of points in the ventilating system.

General mine ventilation Underground mine ventilation is particularly important in situations where heavy machinery is in operation, as plants such as drills and long haul dumps have a huge impact on humidity and temperature. On top of this, extraction can release gases which are harmful to staff working below ground.
