For this model, it's convection on the large faces of the fin that are exposed to ambient air. Figure 15 - Submodel Convection Load on Fin Exposed Faces. Since there are three load steps in the coarse model and we told ANSYS to map results from all time points, I set the number of steps to three in Analysis Settings, then solved the submodel.

It highlights introduction to conduction, Fourier's law, thermal resistance and explain how to carry out thermal conduction analysis using ANSYS workbench and validate with analytical calculations.

Conduction Thermal Analysis of Plate using ANSYS

In thermal transient analysis, time-dependent values of the bulk temperature and convection coefficients must be described as functions of time. In the ANSYS finite element analysis program, Table Arrays are often employed to describe these time-dependent functions. This "tips & tricks" article presents a simple example of such a procedure.
