Without a doubt, Linux is the operating system de rigueur in the hobbyist arena. Partly because of the percolation of hobby-ists into the commercial world, and partly simply because of the operating system's own merits, there is large and growing com-mercial use of and support for Linux-based embedded solutions.

Some examples include Altera's Excalibur, QuickMIPS from QuickLogic, and Xilinx's Virtex II. I believe chips like these represent the future of embedded system design, but they need a new type of tool set for software development, and software synthesis should be part of that new tool set. These new FPGAs are resource-limited.
