Solution We are to discuss the difference between uniform and nonuniform flow. **Analysis** The flow in a channel is said to be uniform if the flow depth (and thus the average velocity) remains constant. Otherwise, the flow is said to be nonuniform or varied, indicating that the flow depth varies with distance in the flow direction.

Incompressible Flow Solutions

Incompressible flows are by far the most common type of flows encountered in engineering problems. They are different than compressible flows mainly due to the missing equation of state. Density is not an unknown and pressure does not have any thermodynamic meaning. In an incompressible flow the role of pressure is ...
