Transaction Processing | Guide books

learn the concepts underlying transaction processing as well as the concurrent executions of transactions. A transaction is a unit of a program execution that accesses and possibly modi es various data objects (tuples, relations). DBMS has to maintain the following properties of transactions: Atomicity: A transaction is an atomic unit of processing, and

9. Transaction Processing Concepts

Following are the main operations of transaction: Read(X): Read operation is used to read the value of X from the database and stores it in a buffer in main memory. Write(X): Write operation is used to write the value back to the database from the buffer. Let's take an example to debit transaction from an account which consists of following operations:
